

Desktop computer

Team Group Delta White RGB 16GB (2x8GB) 3200MHz (PC4-25600) CL16 - Memoria DDR4.

I think that this ram memory is good for a desktop computer because making reference to the latency, which has to be within 6 to 20 milliseconds, this ram has 16 milliseconds, which is about average. The encapsulation is good for a desktop computer because it is big and the capacity is 16GB. 2x8GB is the capacity you need to play videogames comfortably. Also have compatibility with almost everything.

- ***Corsair Vengeance SODIMM 16GB (2x8GB) DDR4 2933MHz CL19 Memory to laptops/Notebooks - Black***
- I saw this one and it's like that I have in my self laptop, this one is compatible with many computers amd, intel's nuc and pc with a small format. The configuration is automatic to accelerate the times of charge multitask and more. About the technically details we have things like is not too much heavy, it has 12 capacity ram, technology with DDR4 and a velocity of the clock is 2933 mhz.

- Normally the ram in mobile phones is not able to be removed so we search for a memory ram that looks good for us.
- Internal memory depends on the size of the mobile if you have a table that usually has more memory than other mobile phones. For example the basic iphone 14 have less memory than iphone 14 pro max.
